Assignment: Remote Desktop Services (RDS) Configuration in Windows Server

1. Install the Remote Desktop Services (RDS) Role

Steps:

1. Open Server Manager.
2. Click Manage → Add Roles and Features.
3. Click Next until you reach Installation Type.
4. Select Remote Desktop Services Installation.
5. Choose Quick Start (for a single server) or Standard Deployment if required.
6. Select Session-based desktop deployment.
7. Choose your local server.
8. Click Next and then Deploy.
9. Wait for the installation to complete.
10. Restart the server if prompted.

Result: The Remote Desktop Services (RDS) role is installed successfully.

2. Create a Session Collection and Publish RemoteApps

Steps:

1. Open Server Manager.
2. Select Remote Desktop Services from the left pane.
3. Click Collections.
4. Click Tasks → Create Session Collection.
5. Enter the collection name StudentApps.
6. Add your local server as the Session Host.
7. Click Next and Create.
8. After the collection is created, select StudentApps.
9. Under RemoteApp Programs, click Tasks → Publish RemoteApp Programs.
10. Select:
 - Notepad

- Calculator

11. Click Publish.

Result: A session collection named StudentApps is created, and Notepad and Calculator are published as RemoteApps.

3. Create a Local User and Allow Remote Desktop Access

Steps:

1. Open Computer Management.
2. Go to Local Users and Groups → Users.
3. Right-click Users → New User.
4. Create the user with:
 - Username: testuser
 - Password: *(Set a secure password.)*
5. Click Create.
6. Open Groups.
7. Double-click Remote Desktop Users.
8. Click Add.
9. Add the user testuser.
10. Click OK.

Enable Remote Desktop

1. Open Server Manager → Local Server.
2. Click Remote Desktop.
3. Select Allow remote connections to this computer.
4. Click Apply and OK.

Verification

1. From another computer, open Remote Desktop Connection (mstsc).
2. Enter the server IP address.
3. Log in using:
 - Username: testuser
 - Password: *(The password created earlier.)*

Result: The testuser account successfully connects to the Windows Server using Remote Desktop.

4. Simulate Multiple Remote Desktop Sessions

Steps:

1. Open **Remote Desktop Connection (mstsc)** on the client PC.
2. Connect to the server as **Administrator**.
3. Open another Remote Desktop session.
4. Connect using the **testuser** account.
5. Observe the server behavior.

Observation

- Both **Administrator** and **testuser** can log in simultaneously if the server supports multiple Remote Desktop sessions.
- CPU and memory usage increase as more users connect.
- If Remote Desktop licensing is not configured, Windows Server may allow only the default administrative sessions or display licensing warnings after the grace period.
- Additional users may be denied access if the maximum number of allowed sessions is reached.

Result

The server successfully handled simultaneous Remote Desktop connections. Resource usage increased with multiple active sessions, and session limits depended on the server configuration and Remote Desktop licensing.
