

NAME: Diya Shah

Topic: Windows Server 2019 Security, Backup and Monitoring Configuration.

1. Configure a local security policy on your Windows Server to enforce password complexity requirements, then take a screenshot of the policy settings window.

Press Win + R

Type:

secpol.msc

Open:

Local Policies → Security Options → Password Policy

Configure Password Settings:

Set these:

Password must meet complexity requirements → Enabled

Minimum password length → 8 or 10

Maximum password age → 45 days (optional)

Minimum password age → 1 day

2. Enable Windows Defender on your server and schedule a daily quick scan at a specific time using Windows Task

Scheduler.
Hint: Use the 'Task Scheduler' app and select 'Windows Defender Scheduled Scan' as the task.

⇒ Press Win + R

Type:

taskschd.msc

Create Task:

Click Create Basic Task

Name:

Windows Defender Daily Scan

Trigger:

Daily

Time:

Choose (e.g., 10:00 AM)

Action:

Start a Program

Program Settings:

Enter:

Program: powershell.exe

Arguments:

Start-MpScan -ScanType QuickScan

3. Set up a basic scheduled backup for a folder named 'ProjectFiles' on your server using Windows Server Backup, and save the backup to a different drive.

⇒ Step 1: Install Backup Feature

Server Manager

Add Roles and Features

Select:

Windows Server Backup

Install

Step 2: Create Folder

Create:

D:\ProjectFiles

Put sample files inside.

Step 3: Open Backup Tool

Run:

wbadmin.msc

Step 4: Schedule Backup

Click:

Backup Schedule

Select:

Custom

Choose:

D:\ProjectFiles

Destination:

Select different drive (Example: E:\Backup)

Step 5:

Schedule: Daily or Weekly

Time: e.g. 7:00 PM

Finish setup

4. Install and configure Performance Monitor to track CPU and memory usage on your server for 30 minutes, then export the collected report as a screenshot or CSV file.

⇒ Step 1: Open Tool

Press:

Win + R → perfmon

Step 2: Add Counters

Click Performance Monitor

Click + Add Counters

Add:

Processor → % Processor Time

Memory → Available MB
Step 3: Run for 30 Minutes
Leave it running while server is active.
Step 4: Export Report
Option 1: Screenshot
Use:
Windows + Shift + S
Option 2: Export Data
Go to:
Data Collector Sets → User Defined
Right click → Save / Export as CSV

5. Write a short report (200-300 words) describing the security policies, backup schedule, and monitoring tools you configured, including any challenges faced and how you resolved them

- ⇒ In this practical, I configured essential security, backup, and monitoring tools on Windows Server 2019 to improve system reliability and protection.
- ⇒ First, I implemented password complexity requirements using the Local Security Policy tool. I enabled the “Password must meet complexity requirements” setting and defined a minimum password length. This ensures that users create strong passwords, reducing the risk of unauthorized access and brute-force attacks.
- ⇒ Next, I enabled Windows Defender and configured a scheduled quick scan using Task Scheduler. A daily scan task was created using PowerShell commands to automatically run antivirus scans at a fixed time. This helps maintain continuous protection against malware without manual intervention.
- ⇒ For data protection, I configured Windows Server Backup to back up the “ProjectFiles” folder. The backup was scheduled to run automatically and stored on a separate drive, ensuring data recovery in case of system failure or corruption.
- ⇒ Finally, I used Performance Monitor to track CPU and memory usage over a 30-minute period. Counters such as Processor Time and Available Memory were added, and performance data was reviewed and exported.
- ⇒ The main challenge faced was correctly configuring Task Scheduler commands for Windows Defender, which was resolved by using PowerShell scan commands. Overall, this practical helped me

understand system security, backup strategies, and performance monitoring in a Windows Server environment.
